Definition of CW-complexes

Let X be a Hausdorff space. A *CW complex* on X consists of a family of indexing sets $(I_n)_{n\in\mathbb{N}}$ and a family of maps $(Q_i^n \colon D_i^n \to X)_{n\geq 0, i\in I_n}$ s.t.

(i) $Q_i^n|_{\mathrm{int}(D_i^n)} : \mathrm{int}(D_i^n) \to Q_i^n(\mathrm{int}(D_i^n))$ is a homeomorphism. We call $e_i^n := Q_i^n(\mathrm{int}(D_i^n))$ an *(open) n-cell* (or a cell of dimension n) and $\overline{e}_i^n := Q_i^n(D_i^n)$ a *closed n-cell*.

(ii) For all $n, m \in \mathbb{N}$, $i \in I_n$ and $j \in I_m$ where $(n, i) \neq (m, j)$ the cells e_i^n and e_j^m are disjoint.

(iii) For each $n \in \mathbb{N}$, $i \in I_n$, $Q_i^n(\partial D_i^n)$ is contained in the union of a finite number of closed cells of dimension less than n.

(iv) $A \subseteq X$ is closed iff $Q_i^n(D_i^n) \cap A$ is closed for all $n \in \mathbb{N}$ and $i \in I_n$.

(v) $\bigcup_{n\geq 0} \bigcup_{i\in I_n} Q_i^n(D_i^n) = X$.

We call Q_i^n a *characteristic map* and $\partial e_i^n := Q_i^n(\partial D_i^n)$ the *frontier of the n-cell* for any i and n.

Project Overview

The current progress in terms of files/topics looks like this:

- Definition and basic properties: In mathlib
- Finiteness notions on CW Complexes: PR
- Subcomplexes: Done
- Basic constructions: Done
- KSpaces: PR
- Additional Lemmas: Done
- Product: Done
- Examples: Needs clean-up
- Maps: Work in progress
- Quotients: To be done (by me)
- Equivalence to other definition: To be done (probably not by me)

Subcomplexes: The mathematics

Definition: Subcomplex

A subcomplex of X is a set $E \subseteq X$ together with a set $J_n \subseteq I_n$ for every $n \in \mathbb{N}$ such that:

(i) E is closed.

(ii) $\bigcup_{n \in \mathbb{N}} \bigcup_{i \in J_n} e_i^n = E$.

Theorem: Subcomplexes are CW complexes

Let $E \subseteq X$ together with $J_n \subseteq I_n$ for every $n \in \mathbb{N}$ be a subcomplex of the CW complex X. Then E is again a CW complex with respect to the cells determined by J_n and X.
